

## Volute Casing Centrifugal Pumps PN 16 of Inline Design with lateral Feet

### Series NISM

#### With serial standard motors

##### **Application**

For handling fresh water, sea water, condensate, oils, brines, lyes etc. The fluids pumped must not contain any abrasive particles nor chemically attack the construction materials of the pumps.

##### **Main Fields of Application**

In shipbuilding: as general service and fire pump, bilge, ballast and cooling-water pump, as drinking and sea-water sanitary pump as well as circulating pump for heating systems.

In all industrial branches: for general water supply as well as in heating, cooling and circulation systems.

##### **Design Description**

The characteristic feature of this pump is the design of the connection pump shaft – motor shaft allowing the employment of serial standard motors with a locating-type bearing and normal shaft end.

Any and all screw connections are by means of hexagonal screws and hexagonal nuts so as to ensure their proper unscrewing even with several coats of paint (shipbuilding).

**The requirements of DIN 31 001 „Protection against accidental contact“ are met.**

##### **Type and Series Construction**

Single-stage, single-flow volute casing centrifugal pump. Series assembly according to the unit assembly system.

Volute casing of inline design. Nominal capacities according to DIN 24 255.

Series NISM 2/32-200, 2/40-250 and 2/50-250 are two-stage, but their outer dimensions correspond to the respective single-stage sizes. Owing to the two-stage design, relatively small delivery flows are achieved with great delivery heads, good efficiencies and low NPSH values.

These pumps can be mounted in any position. For safety purposes, the arrangement with „motor downwards“ is not admissible.

**Attention:** The pump denomination gives the standard nominal diameter on the delivery side according to DIN 24 255, as this diameter, in connection with the impeller diameter, is also a characteristic of the hydraulic capacity of the pump.

The actual nominal widths on the suction and delivery sides of sizes having a shaft diameter of 30 mm, are identical. The nominal width on the delivery side is greater by one nominal width each than as per DIN 24 255 (e.g. NISM 32-160 with  $D_{N_s}/D_{N_d} = 40 \text{ mm}$ ). The actual nominal widths on the suction and delivery sides of sizes having a shaft diameter of 40 mm, are greater by one nominal width each than as per DIN 24 255 (e.g. NISM 80-250 with  $D_{N_s} = 125 \text{ mm}$  and  $D_{N_d} = 100 \text{ mm}$ ).

For sizes with shaft diameter 30 mm or 40 mm, please refer to table „Combination of Components,” page 3.

##### **Branch Position, Flanges**

Suction and delivery branches arranged opposed in one line.

Flanges: up to DN 150 as per DIN 2533  
DN 200 and above as per DIN 2532

##### **Shaft Sealing**

Single-stage pump sizes by uncooled stuffing box with internal sealing. Packing rings of Teflon-impregnated white asbestos yarn of the diaplex-type of braiding.

Single- and two-stage pump sizes by uncooled, maintenance-free mechanical seal of the unbalanced type of construction.

##### **Material design:**

Rotary seal ring	Hard carbon
Stationary seal ring	Oxide ceramics
O-rings	Viton <sup>®</sup>
Metal parts	Stainless steel

<sup>®</sup> With water over 100°, EP caoutchouc

##### **Bearing/Lubrication**

By means of the grease-lubricated grooved ball bearings incorporated in the motor as per DIN 625.

##### **Upper Temperature <sup>®</sup> and Pressure Limits**

Apply to all material designs.

Admissible temperature of fluid pumped with stuffing box uncooled	125°C
mechanical seal uncooled	140°C
Admissible internal pump pressure for sizes with shaft diameter 30 mm with stuffing box	16 bar
unbalanced mechanical seal	10 bar
Admissible internal pump pressure for sizes with shaft diameter 40 mm	10 bar

Admissible admission pressure	Admission pressure plus max. delivery head must not exceed the admissible internal pump pressure
-------------------------------	--

<sup>®</sup> The admissible temperatures apply to water. In case of other fluids to be pumped, the temperature limits may change.

##### **Dismantling of Driving Unit**

When dismantling the driving unit, the volute casing may remain in the piping.

The driving unit comprises all pump components except for the volute casing.

**Combination of Components**

The table on page 3 shows the combination possibilities of components of all NISM sizes.

**A material advantage is the fact that independently of the size, the motor capacity and motor design, with the single-stage sizes, only one casing cover per shaft diameter is required for the shaft sealing with stuffing box and only one casing cover for the shaft sealing with mechanical seal.**

**Connections**

The following connections are always provided:

- A1 Filling or control pressure tap for automatic breather
- B1 Drainage
- D8 Seepage drain
- E3 Venting
- E4 Venting with automatic breather
- M1,M2 Pressure gauge

**Drive**

Surface-cooled three-phase squirrel-cage induction motors, IMV1 type of construction, enclosure IP 44/IP 54 according to IEC Standard, class B insulation, capacities and main dimensions according to DIN 42677.

The following table shows the possible voltages and starting varieties as a function of the motor performance.

Motor performance	Voltage and starting variety			
	220 V	380 V		
kW	△	Y	△	Y△
up to 2.2	X	X	—	—
above 2.2	—	—	X	X

NISM pumps with single-phase a.c. motors are not available.

**Motor Design**

All three-phase motors on all NISM centrifugal pumps are equipped with a locating-type bearing. Also, only such motors may be attached.

Some sizes (different depending upon the manufacturer) have the locating-type bearing as a serial equipment.

**Automatic Breather A 25 A**

For details, please refer to the back page of this brochure.

**Automatic Breather A25A**

The A 25 A is employed for the automatic venting of pump and suction line. It operates with a pressure-dependent control system.

Owing to a pressure-controlled shut-off valve in the suction line, the device can also be used in plants in which excess pressure is temporarily incurred.

**Function description:**

By way of the venting line, suction branch Q2 of the automatic breather is connected with connection E4 of the pump. The compressed air required for the venting process is supplied to the ejector at connection Q1.

In order to avoid any dry operation of the pump, the electric circuit arrangement (not included in the normal scope of supply) must be such that the pump is switched on only after the entire suction system has been vented.

As soon as a delivery pressure has been built up and the preset pressure limit reached, the automatic breather is switched off by the pressure switch. The impulse is transmitted by way of the control pressure line coupling connection A1 at the pump with connection Q4 at the pressure switch.

The delivery pressure dropping below the preset pressure limit, the automatic breather is switched on again.

According to the respective operating conditions, the pressure switch should be adjusted so as to switch the automatic breather off at approx. 80 % of the lowest delivery pressure, switching it on again at approx. 30 %.

Required control voltage 220 V, 50 Hz or 60 Hz; power consumption during starting 21 VA, in operation 12 VA; enclosure IP 54.

**Materials:**

Lower nozzle: Plastic

Upper nozzle: Plastic

Inlet nozzle: G-CuZn 16Si4

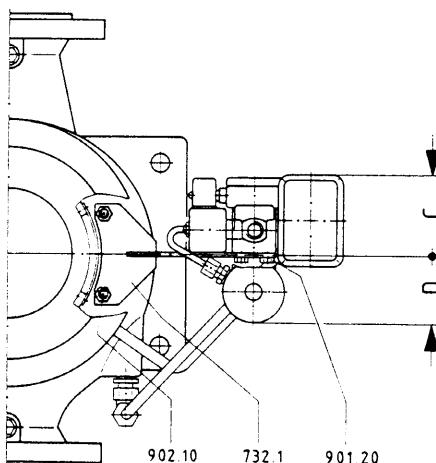

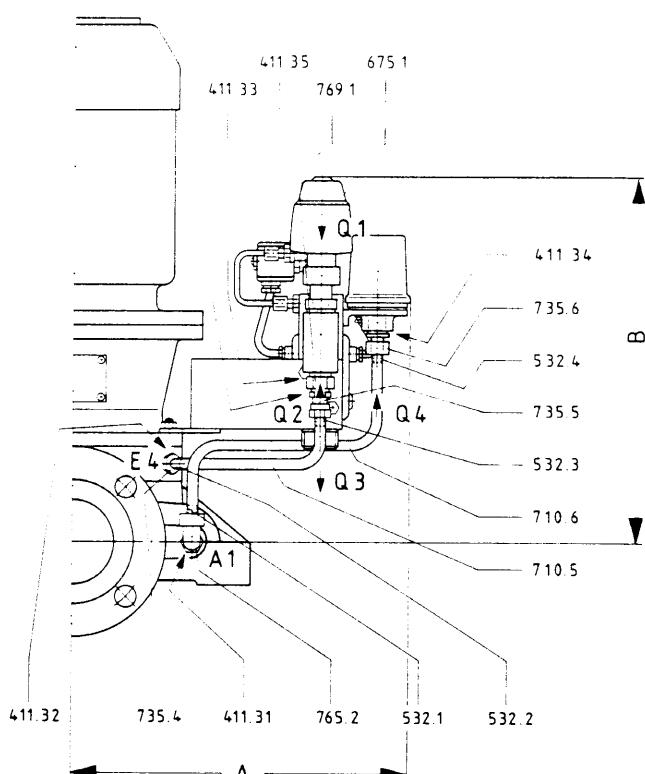

Pipes ①: Cu

① Coming into contact with the fluid pumped.

Driving air consumption at 6 bar operating pressure  $Q = 0.28 \text{ m}^3/\text{min}$ .

The water-air mixture is exhausted through connection Q3.

Size with shaft diameter 30

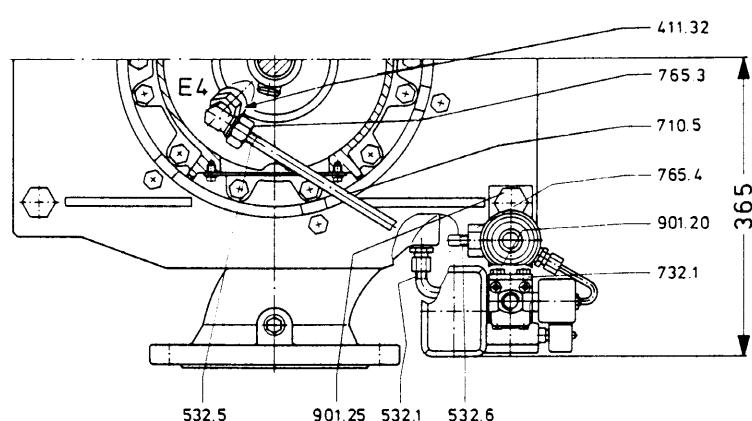

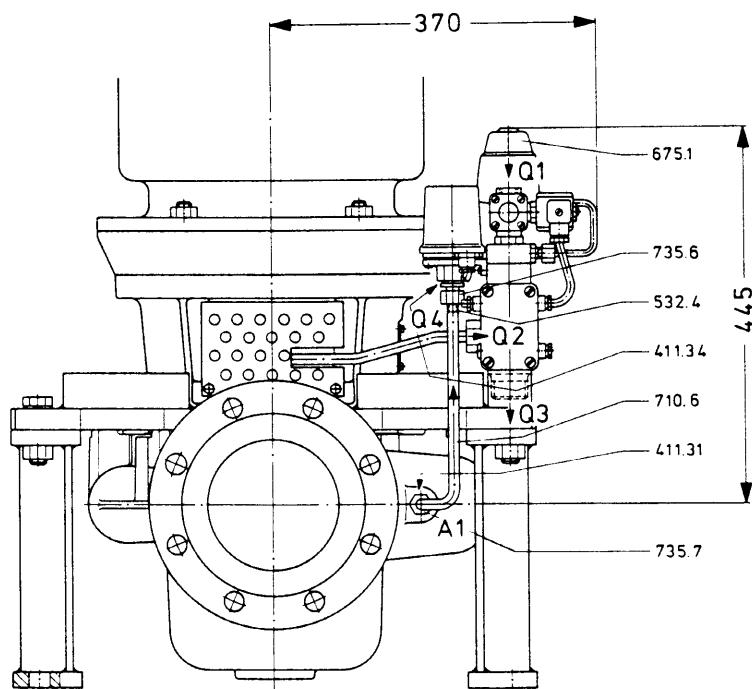

List of components for the mounting-type automatic breather A25A, Series NISM:
